Please find below and/or attached an Office communication concerning this application or proceeding.

**Office Action Summary**

Application No.

09/658,387

Applicant(s)

TAN, AURELIANO

Examiner

Paula W. Klimach

Art Unit

2135

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 06 September 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1, 6, 8, 9, 30, 32, 34, 54, 59, 64 and 69-75 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1, 6, 8, 9, 30, 32, 34, 54, 59, 64 and 69-75 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

### *Continued Examination Under 37 CFR 1.114*

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 09/06/06 has been entered.

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

**Claims 1, 6, 8-9, 30, 32, 54, 59, 69-72** are rejected under 35 U.S.C. 103(a) as being unpatentable over Jones (5623637) in view of Gammie et al (5237610) and further in view of the article by Friedman ("The Trustworthy Digital Camera: Restoring Credibility To The Photographic Image").

*In reference to claim 1*, Jones discloses a system for storing a password value and logic circuitry for preventing access to information stored on the memory card unless the user of the host computer to which the memory card is connected can supply a password matching the stored password (abstract). Jones also discloses a microprocessor (Fig. 1 part 260). Jones

Art Unit: 2135

discloses further digital identity data (password part 301 Fig. 2), wherein the digital identity data uniquely identifies a user of the digital identity device. The password is digital data that uniquely identifies a user because only the user would know the password (column 3 lines 39-43 in combination with column 8 lines 35-41). The system of Jones contains a memory configured to store at least the digital identity data (column 7 lines 32-41). The system of Jones discloses digital identity data that is encrypted by the digital identity data using an algorithm that uses a random number (column 8 lines 4-34)

Although Jones discloses a microprocessor (Fig. 1 part 260) and the encryption of the user data, Jones does not disclose a microprocessor wherein the identity is stored in the microprocessor.

Gammie discloses a system for identifying an authentic user of the decoder using a doubly encrypted key wherein the key is encrypted first by a serial number and encrypted again by a second serial number (abstract). Therefore the system discloses the encryption of person information (key) using serial number (column 12 lines 5-19).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to encrypt the unique user data (key) using the unique device data (serial number) as in Gammie in the system of Jones. One of ordinary skill in the art would have been motivated to do this because each serial number is unique to the individual device therefore the key will not be subject to compromise or recovery (column 3 lines 9-16 in combination with lines 23-26).

Although Jones discloses a microprocessor and the encryption of the user data, and Gammie disclose the encryption of user data with a serial number, neither Jones nor Gammie disclose the storage of the serial number in the microprocessor.

Art Unit: 2135

Friedman discloses a method securing a digital image (abstract). The image is secured using a unique key, therefore identification, which is etched to the camera's secure microcontroller (page 908 column 2, the first full paragraph).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to etch the key into the controller as performed by Friedman in the system of Jones. One of ordinary skill in the art would have been motivated to do this because credibility of the camera's output becomes an extension of that of the manufacturer; thus a digital signature from the camera can be considered to be just as reliable and secure as if the signature had been generated by the manufacturer (Friedman page 908 column 1, the first full paragraph).

*In reference to claims 6, 54, and 59, wherein the digital identity is for one of the group consisting of an individual and a corporation; and wherein the digital identity at least one selected from the group consisting of a name, a digital picture, an address, a date of birth, a social security number, a driver's license number, a digital photograph, biometric information, credit card information, bank account information, an incorporation name, a date and place of incorporation, a name of a corporate officer, a corporate partner, and a database administrator name (business data, column 1 lines 15-25).*

*In reference to claim 8, wherein the digital identity device further comprises a computer an interface configured to enable the digital identity device to communicate with an external device (Fig. 1).*

*In reference to claim 9, wherein the interface comprises an input/output port (column 5 lines 50-55).*

*In reference to claims 30 and 32,* The applicant does not define “binding digital identity data,” as a result the definition of “binding the digital identity data” is constraining the microprocessor identity device to the digital identity data with legal authority. The system of Jones discloses using digital signatures techniques can be readily implemented using the password protected secure memory (column 9 lines 40-47) therefore binding digital identity data associated with the memory device with the memory devices of a microprocessor operatively connected to the property. Jones further discloses verifying the identity of the property by querying the microprocessor wherein the digital identity data is bound to the card Id. The card exchanges the certificate which contains the card Id with the transaction terminal and the identities of the authenticated user (column 7 lines 40-50). Jones further discloses determining the origin of the electronic communication using the tagged communication (Fig. 2).

Although Jones discloses the encryption of the user data (password, column 8 lines 4-34), Jones does not discloses the encrypting the electronic communication using the digital identity data.

Gammie discloses a system for identifying an authentic user of the decoder using a doubly encrypted key wherein the key is encrypted first by a serial number and encrypted again by a second serial number (abstract). Therefore the system discloses the encryption of person information (key) using serial number (column 12 lines 5-19). The encryption of the key using the serial number binds the serial number to the user identity.

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to encrypt the unique user data (key) using the unique device data (serial number) as in Gammie in the system of Jones. One of ordinary skill in the art would have been motivated

Art Unit: 2135

to do this because each serial number is unique to the individual device therefore the key will not be subject to compromise or recovery (column 3 lines 9-16 in combination with lines 23-26).

Although Jones discloses a microprocessor and the encryption of the user data, and Gammie disclose the encryption of user data with a serial number, neither Jones nor Gammie disclose the storage of the serial number in the microprocessor.

Friedman discloses a method securing a digital image (abstract). The image is secured using a unique key, therefore identification, which is etched to the camera's secure microcontroller (page 908 column 2, the first full paragraph).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to etch the key into the controller as performed by Friedman in the system of Jones. One of ordinary skill in the art would have been motivated to do this because credibility of the camera's output becomes an extension of that of the manufacturer; thus a digital signature from the camera can be considered to be just as reliable and secure as if the signature had been generated by the manufacturer (Friedman page 908 column 1, the first full paragraph).

*In reference to claims 69-72 wherein the user is a corporation and wherein the digital identity data comprises at least one selected from the group consisting of an incorporation name of the corporation, a data and place of incorporation of the corporation, a name of a corporate officer of the corporation, and corporate partner of the corporation.*

Friedman discloses a method securing a digital image (abstract). The image is secured using a unique key, therefore identification, which is etched to the camera's secure microcontroller (page 908 column 2, the first full paragraph).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to etch the key into the controller as performed by Friedman in the system of Jones. One of ordinary skill in the art would have been motivated to do this because credibility of the camera's output becomes an extension of that of the manufacturer; thus a digital signature from the camera can be considered to be just as reliable and secure as if the signature had been generated by the manufacturer (Friedman page 908 column 1, the first full paragraph).

**Claims 34, 64, and 73-75** are rejected under 35 U.S.C. 103(a) as being unpatentable over Jones (5623637) in view of Gammie et al (5237610) and further in view of Friedman as in claim 1 and further in view of Guthery and Yap et al (6,111,506).

*In reference to claims 34 and 73*, is rejected as disclosed in claim 1 above. The additional limitation of obtaining digital identity data from a digital device operatively connected to a computer in which the electronic document is stored is taught by Guthery.

Guthery discloses a computer having a microprocessor containing identity information (column 5 lines 25-40 in combination with column 6 line 49 to column 7 line 5). The system includes obtaining digital identity data from a digital identity device operatively connected to a computer in which the electronic document is stored (Fig. 1). Guthery discloses a system that comprises a microprocessor (Fig. 2 part 52). Guthery further discloses a system that comprises digital identity data wherein the digital identity data is associated with a user of the digital identity device; a memory configured to store at least the digital identity data (column 5 lines 7-15; column 6 lines 44-50; column 7 lines 13-21; Fig 2 part 58).

Art Unit: 2135

Guthery discloses a card ID (column 7 lines 1-5) which poses as the microprocessor identity due to the fact that the card ID belongs to the card; and therefore everything on the card and the card only has one microprocessor (Fig. 2). It follows that the ID identifies the contents of the card and therefore identifies the microprocessor. Even if the card ID is not a microprocessor identity, Paolini discloses a method and apparatus is disclosed for preventing an unauthorized computer system from using copied software or data (abstract). The system uses a CPU ID (microprocessor ID) of a particular computer system (column 3 lines 1-5).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to use a microprocessor ID in the smart card of Paolini in the system of Guthery. One of ordinary skill in the art would have been motivated to do this because the ID is a unique quantity that can be used to prevent the use of copied software.

Although Guthery discloses storing information such as licenses and therefore documents (column 6 lines 45-50) and the system has passwords (column 6 lines 62-67) and a program for encryption (column 6 lines 25-30), Guthery does not disclose encrypting the documents

Yap discloses storing documents on the smart card. The documents are encrypted.

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to encrypt the documents as in Yap with the digital identity data of Guthery and storing the documents on the smart card as in Guthery. One of ordinary skill in the art would have been motivated to do this because it would discourage forgery.

Guthery and Paolini do not disclose the etching of the microprocessor identity information into the microprocessor

Art Unit: 2135

Friedman discloses a method securing a digital image (abstract). The image is secured using a unique key, therefore identification, which is etched to the camera's secure microcontroller (page 908 column 2, the first full paragraph).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to etch the key into the controller as performed by Friedman in the system of Jones. One of ordinary skill in the art would have been motivated to do this because credibility of the camera's output becomes an extension of that of the manufacturer; thus a digital signature from the camera can be considered to be just as reliable and secure as if the signature had been generated by the manufacturer (Friedman page 908 column 1, the first full paragraph).

*In reference to claims 64 and 74*, wherein the digital identity is for one of the group consisting of an individual and a corporation; and wherein the digital identity at least one selected from the group consisting of a name, a digital picture, an address, a date of birth, a social security number, a driver's license number, a digital photograph, biometric information, credit card information, bank account information, an incorporation name, a date and place of incorporation, a name of a corporate officer, a corporate partner, and a database administrator name (bank information, column 7 lines 45-47; and column 6 lines 47).

*In reference to claim 75* wherein the user is a corporation and wherein the digital identity data comprises at least one selected from the group consisting of an incorporation name of the corporation, a data and place of incorporation of the corporation, a name of a corporate officer of the corporation, and corporate partner of the corporation.

Art Unit: 2135

Friedman discloses a method securing a digital image (abstract). The image is secured using a unique key, therefore identification, which is etched to the camera's secure microcontroller (page 908 column 2, the first full paragraph).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to etch the key into the controller as performed by Friedman in the system of Jones. One of ordinary skill in the art would have been motivated to do this because credibility of the camera's output becomes an extension of that of the manufacturer; thus a digital signature from the camera can be considered to be just as reliable and secure as if the signature had been generated by the manufacturer (Friedman page 908 column 1, the first full paragraph).

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Paula W. Klimach whose telephone number is (571) 272-38544.

The examiner can normally be reached on Mon to Thr 9:30 a.m to 5:30 p.m.

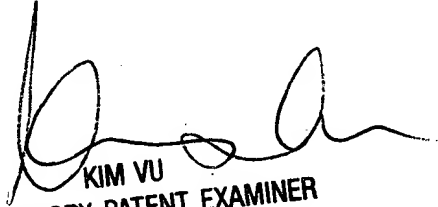

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kim Vu can be reached on (571) 272-3859. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
